

The attached VQI smart texts are located in Epic User Web (the link is below and you can set up an account if you don't already have one)

<https://signin.epic.com/adfs/ls/?wa=wsignin1.0&wtrealm=https%3a%2f%2fuserweb.epic.com%2f&wctx=rm%3d1%26id%3dpassive%26ru%3d%252F&wct=2015-06-25T16%3a40%3a55Z>

1. Go into the Community Library Link at the top of the Epic User Web homepage:

2. Enter the name of the smart text (from the spreadsheet) into the All Content window to pull up the smart text in the Community Library.

3. Your IT department can pull these smart texts into your Epic environment, as long as doing is OK with your institution's policy.
4. If you have questions about how to use the smart texts once they are pulled into your environment, please let us know. Right now, smart texts are inserted into notes and the provider fills out the information; however, an abstractor still has to review the note and manually enter the information into VQI. Even so, the smart texts make data collection more efficient and accurate because it's coming from the provider at the point of care.

A couple of additional note---

- We have built PVI smart texts that reflect the updated PVI module coming soon from M2S. Please know that these are not yet in Epic User Web. I'd eventually like to make these available on there, but want to make sure they are working properly first. The URMV PVI smart texts that are currently Epic User web only reflect the current PVI module (not the new one).
- We have also created some updated CEA smart texts that are "SDE-enabled", which means they will allow us to extract VQI data right from the record via a SQL query (we hope to be able to pull the most of the CEA data into a file and send to M2S for upload, thus eliminating manual data entry). However, these SDE-enabled CEA smart texts are not available on Epic User Web yet. Again, we haven't started using them yet and want to make sure everything is working before we put them out there.
